SQL & sqlite3

5 main steps

(1) >>> import sqlite3

(2) >>> connection = sqlite3.connect('eg.db')

→ connecting to a dB.

(3) >>> cursor = connection.cursor()

→ ~~makes~~ reference a cursor inside the ~~sql~~ connection

(4) >>> cursor.execute('''
SQL query
''')

→ execute your query.

(5) >>> connection.commit() → commit the changes.

(6) >>> connection.close() → close the conn.

To use fetched data,

```
rows = cursor.fetchall()
for r in rows:
    print(r)
```

← after a SELECT statement only.

(A) cursor.executemany('''insert into X (a, b, c, d)
values (?, ?, ?, ?)
''', sales_data)

Sales data = list of tuples
